

AI solutions that prove their own working.

Every answer shows the source. Every figure shows the calculation. What we build, what each solution includes, what each costs, and how to start.

Wrigital Ltd, Nottingham · hello@wrigital.com

What is in this brochure

1.	The Verified Assistant
2.	Number auditing
3.	Client intelligence, and FinPrint
4.	Bespoke solutions for other work
5.	The AI Specification
6.	The quarterly rhythm
7.	Coming soon
8.	Prices, at a glance
9.	How to start

Everything here is built to the same five rules. Your standard becomes the specification. We write code rather than assemble templates. Nothing reaches you unchecked. The solution fails loudly rather than guessing. And the professional stays in charge, with the record writing itself as the work happens.

The Verified Assistant

An assistant that answers from sources you approved, and proves every source when asked.

Your people are already using AI. The question is whether anyone could reconstruct where an answer came from.

The Verified Assistant answers only from a library your firm has approved. Every factual claim carries a citation, every citation was fetched and checked in code before entering the library, and every source opens when clicked. Ask about something outside the library and the system says so rather than filling the gap.

What the solution includes

- A library in three layers: sources universal to your sector, sources curated to your specialism, and your own firm material as a separate labelled tier, so the reader always sees whether a claim came from an authority or from your files
- Verified citations on every factual claim, checked automatically before entering the index
- Labelled options with trade-offs wherever a question calls for professional judgement, never a single instruction
- A recorded rationale before any answer can be accepted, saved with the answer as a single file, with the citations still clickable
- Deletion and full rebuild of the library every quarter, with every citation re-verified from scratch
- A source audit report showing what the assistant is allowed to read, included as standard
- Running inside your own tenant, on your own intranet, so your questions never leave your environment

5. Tax Planning Opportunities

Pension annual allowance: The brief shows an available allowance of **£20,000** with **£0 contributed year-to-date** and **£20,000 remaining** (not exhausted). Note that the standard pension annual allowance is generally £60,000 for most individuals, potentially tapered for higher earners ([gov.uk — Annual allowance](#)). Please confirm the client's income to determine whether tapering applies ([easymoney.com, 2025](#)) — the £20,000 figure in the brief should be reconciled against this.

ISA allowance: The ISA annual allowance is £20,000. Ongoing ISA funding can provide a tax-free income source alongside the pension in retirement.

Personal allowance: With a personal allowance of £12,570 and the state pension of £11,502, careful sequencing of pension and ISA withdrawals can help make efficient use of allowances and manage the client's income tax position.

Tax-free cash and drawdown sequencing: Consider how the pension's tax-free element, ISA (tax-free) withdrawals and taxable pension income are combined to minimise overall tax.

6. Recommended Next Steps

Reconcile the £33,498 "not covered" flag with the "sustainable" outcome before finalising advice.

Confirm the client's earnings to verify the pension annual allowance position (£20,000 vs standard £60,000 / tapering).

Extend the sustainability modelling beyond 7 years to reflect longevity.

An answer from the assistant. Look at what happens with the pension allowance. The brief says £20,000. The standard allowance is £60,000. Rather than writing smoothly past the discrepancy, the assistant cites both sources, states the conflict and tells the adviser to confirm the client's earnings before advising. Further down, a £33,498 shortfall is flagged rather than buried. A general model would have produced a fluent paragraph and left both problems for somebody to find later.

The sources behind that answer, listed with the address and the moment each page was read. Click any line and the page opens. Locked to the answer, so the record cannot be edited afterwards.

The proven version

We built the assistant first for UK FCA-regulated advice firms, where the standard of proof is highest and the consequences of a wrong answer are formal. That version has a published price: **£1,200 to build, then £250 a month**, with the opening cohort limited to three firms.

The same solution applies wherever answers must be defensible. A solicitor grounding advice in current legislation. An accountant working from live HMRC positions. A manufacturer whose engineers need the approved standard rather than an approximation. The library changes. The verification does not.

Number auditing

Every figure traced back to the calculation that produced it.

A language model estimates. Ask the same question twice and the arithmetic can differ, and nothing in the answer tells you which time to trust.

That is tolerable when a figure is a curiosity. Where a figure reaches a client, a regulator, a customer or a set of accounts, the figure has to be right and has to be shown to be right.

So we take the arithmetic away from the model. Calculations run in code, from formulas your firm has approved, and the same inputs return the same output every time. Each figure is then checked against its formula before the figure reaches the output, and the check is recorded.

What the solution includes

- Your calculations written as fixed formulas, agreed with whoever in the firm owns the methodology
- A locked brief of the confirmed inputs, restated to the system at every step, so no figure can drift mid-conversation
- No invented defaults: where an input is missing the calculation stops rather than assuming an average
- Validation of the figures against each other, raising a flag where the numbers cannot reconcile
- A numbers audit alongside every output, carrying whatever detail your firm decides: the figure, the unit, whether the figure was entered or calculated, the formula behind the calculation, and anything else your people want on the face of the audit
- Nothing saved or finalised while the arithmetic is incomplete

Annual pension contribution (assumed)	0	GBP	manually-entered	
ISA contributions YTD (assumed)	0	GBP	manually-entered	
Assumed annual growth rate (moderate risk)	0.05	decimal	manually-entered	
ISA annual allowance	20000	GBP	manually-entered	
Personal allowance	12570	GBP	manually-entered	
Projected pension pot at retirement	1196035.36	GBP	calculated	
Retirement income gap	33498	GBP	calculated	
Income need covered by state pension	false	—	calculated	
Years pot sustains withdrawals	7	years	calculated	
Ending balance after drawdown	1316551.48	GBP	calculated	

Every figure behind the answer, labelled at source. Entered by the adviser, or calculated by the system. No figure appears without saying which. The retirement income gap of £33,498 shown here is the same £33,498 flagged in the answer earlier, so the number in the narrative traces back to the working that produced the number, and the adviser can correct any input before the answer is finalised.

Where this applies

Anywhere the arithmetic carries consequence. Client projections in a financial advice firm. Tax positions in an accountancy practice. Yield and reject rates on a production line. Pricing that has to hold up in a tender.

You decide what the audit shows

I am not a financial adviser, an accountant or a quality manager, and I will not pretend to know what your audit trail needs to satisfy the person who reviews your files. You know. So the level of detail is yours to set at setup, and yours to change afterwards.

The system's job is that every figure can be traced. What your audit puts on the page is your call.

Number auditing is a separate solution from the Verified Assistant, and is quoted separately. Many firms want both, because a cited claim and a checked figure answer the same question in two different places.

Client intelligence, and FinPrint

Walk into the meeting as the best prepared person in the room.

Every professional loses work to somebody who arrived better prepared. Not better qualified. Better prepared.

Preparation is expensive, though, because preparation is research, and research is the part nobody has time for the week the meeting lands. So most firms walk in with a name, a rough sector and whatever the website said.

Client intelligence solves the problem the way the rest of our work does. The system gathers what is publicly known, checks each source before using the source, calculates what can be calculated, and produces a briefing where every claim opens when clicked and every figure shows its working.

What the solution includes

- A verified briefing on the client or prospect, produced before the meeting
- Every claim carrying a citation checked in code, and every figure carrying a numbers audit
- A warnings file raising what the numbers say you cannot afford to miss, generated by validation against real figures rather than a checklist of topics
- A blueprint you inspect and edit before anything is produced, so the shape of the briefing is your choice
- A follow-up briefing after the meeting, run on real figures, giving you a reason to make contact again
- Output as a single file, citations intact, ready to send or file

FinPrint

FinPrint is client intelligence built out for one market: UK advisers serving business owners with high net worth. The frameworks, the report sections, the formulas and the source library are specific to that world rather than a general model guessing at the world. The number auditing is built out furthest here, with every calculation in a report traced to its formula and to the place the result is used.

£12,000 for two reports, with further reports at £500 each, produced within two hours of the meeting.

Work a different market?

The depth is the point, so the pack is built to the market. Tell us who you serve and we will scope the same solution around your clients.

Bespoke solutions for other work

Bring us the problem. We will tell you honestly whether AI solves the problem.

The sections above are solutions we have already built. Most firms arrive with something else, and something else is normal work for us.

We build on Microsoft Azure, and our founder holds the Microsoft Certified Azure AI Engineer Associate qualification. Azure matters for a practical reason rather than a badge: the solution runs inside your own tenant, so your data never leaves your environment, the running costs sit on your own subscription at cost with a spend cap you set, and access is granted by you and revoked by you.

What the services can do

- **Seeing.** A model trained on your own photographs of good and faulty units, checking production as production runs. The same capability reads serial numbers, verifies labelling and counts stock from a camera feed.
- **Reading documents.** Invoices, application forms, delivery notes, handwritten paperwork, turned into structured data and checked against your own rules before anything enters a system.
- **Listening.** Meetings and calls transcribed, separated by speaker, summarised into notes that stay attached to the file rather than living in somebody's memory.
- **Understanding text.** Inbound email sorted and routed, contracts read for the clauses that matter, complaints flagged the day the complaints arrive, personal data redacted before anything reaches a model.
- **Searching your own material.** Grounded answers drawn from your documents with the source attached, which is the foundation the Verified Assistant is built on.
- **Checking output.** Content screened before publication or before reaching a customer.
- **Translating.** Your material and your correspondence, at volume.

What makes the solution ours

Any developer can call these services. The five rules are what turn a call into something you can stand behind: your standard as the specification, verification in code rather than an AI deciding whether the result looks right, loud failure instead of a confident guess, and a record that writes itself as the work happens.

A defect classifier nobody can question is a liability. A defect classifier that logs every decision, flags every uncertain call for a human and proves its accuracy rate is an asset.

Not sure which of these fits your business?

That is what the AI Specification answers. Half a day on site, and a written document telling you what to build, what building costs, and what AI cannot usefully do for you.

The AI Specification

Innovation starts with knowing what to build.

Most firms know AI could do something for them. Few can say what, and fewer still can say what building the thing would involve. So the question sits unanswered for another year while the firms that answered move ahead.

The AI Specification answers the question in writing.

We spend half a day inside your operation, looking at the work as it happens rather than as an org chart describes it. Then we write the specification.

What the document contains

- The tasks in your business AI can do well, and the tasks AI cannot, stated plainly and with reasons
- The task worth doing first, chosen on value to the business rather than on ease of building
- What the solution would need to do, written as requirements a developer can build from
- How each output would be verified, so the result is defensible to whoever has to approve the work
- What the solution involves, and what the solution costs

What the document is worth

£750, fixed.

The specification is yours to keep whatever happens next. Build with us, build with someone else, or put the document in a drawer and decide next year. If you commission a solution from us within ninety days, the £750 comes off the price in full.

Half a day, and the question stops being open.

The quarterly rhythm

A verified solution that has gone out of date is worse than no solution at all, because the solution is confidently wrong and cites its sources while being wrong.

Everything decays. Tax rules change, product ranges move, your own documents get superseded, and a source that was authoritative in March quietly stops being authoritative in September. Nothing in the solution announces the decay. The answers keep arriving, still cited, still formatted, still wrong.

So we do not patch. Every quarter the index is deleted and rebuilt from source, and every citation is fetched and verified again from scratch. Nothing stale survives a cycle, because nothing at all survives a cycle.

What each quarter includes

- Full rebuild of the source library, with every citation re-verified
- A dated audit report showing every source checked, every source accepted and every source dropped, with the reason for each
- Your own additions folded into the next rebuild, so sending us a link is all your firm has to do
- Once a year, a proper look at the design rather than the contents

Strounding Audit Report (live) Generated: 2026-07-28T10:30:02.851Z	
Totals	
· Candidates checked: 250

One library build. Two hundred and fifty candidate sources checked, two hundred and twenty two verified, twenty one thrown out. Seven pages no longer existed. Fourteen existed but did not say what the claim said. Every rejection named, with the address and the reason. This is the record you receive every quarter, and the reason a citation from us means something.

Between rebuilds

Some changes cannot wait a quarter. A Budget, a rule change, a platform switch. Ask for an out of cycle rebuild and the solution is back in service within two working days, with every citation verified exactly as at a scheduled rebuild. Charged separately from the monthly fee.

Why this is the fee rather than an extra

The verification is the product. A citation is worth something because a citation was checked, and a check has a shelf life. The rebuild is what keeps the promise true, so the rebuild sits inside the monthly fee rather than beside it.

The rejection log is the receipt. Every quarter you receive a dated, countable record of what the system was refused permission to believe.

Coming soon

What we are building next.

Training

A calibration session for your team, run on your own scenarios: what good output looks like, what failure looks like, and how to direct a system with professional judgement so the work is something no general user could produce. In development now, with a CPD accredited route planned through a training partner.

Ask on the call if the training matters to your firm, and we will tell you honestly where the work has reached.

Prices, at a glance

Published where a price can honestly be published, quoted where a price cannot.

The AI Specification	£750 fixed. Half a day on site and the written document. Credited in full against any solution commissioned within ninety days.
The Verified Assistant UK FCA-regulated advice firms, one to ten advisers	£1,200 to build, then £250 a month. Six-month term, monthly rolling after that. Opening cohort of three firms, who keep their rate for as long as they stay.
The Verified Assistant, other markets	Quoted on the specification, because the source library is what changes and the library is what takes the work.
FinPrint	£12,000 for two reports, then £500 for each report after. Produced within two hours of the meeting.
Client intelligence for a different market	Quoted on the specification.
Number auditing	Quoted on the specification. A separate solution from the Verified Assistant, and often bought alongside.
Bespoke solutions	Quoted on the specification.
Out of cycle rebuilds	Quoted when you ask, and back in service within two working days.
Running costs	Azure sits on your own subscription at cost, with a spend cap set when the solution is built. No usage caps, no marked-up infrastructure, no surprise invoices.

Why so much is quoted rather than listed

A published price on bespoke work is either padded to cover the worst case or quietly abandoned when the work turns out to be real. The specification exists so the quote comes from your actual operation rather than from a guess, and so you hold the numbers before committing to anything.

How to start

Two ways in, depending on what you already know.

You know the problem.

Book a call. Thirty minutes, describe the work you want done, and we will tell you whether AI solves the problem well. We'll also outline the process and give you a quote.

And if AI is not the right path to go down, we will tell you.

You know AI should be doing something, but not what.

Start with the AI Specification. £750, half a day inside your operation, and a written document telling you which task to automate first, what the solution would need to do, how the output would be verified, and what building the solution costs.

Yours to keep whatever you decide, and credited in full against any solution commissioned within ninety days.

Thirty minutes, and you will know where you stand.

Pick a time that suits you. Bring the problem, and we will tell you honestly whether AI is the answer to it.

Book a call
